

Pressure Tank

Pressure Tank
for household water

The pressure tank plays 2 important roles.

- 1 - It receives water from the well pump for household distribution.
- 2 - It allows the well pump longer running cycles therefore enabling longer pump life.

The above pic shows a standard size pressure tank (20-gallon , 16" wide x 32" tall). Pressure tanks, however, come in many sizes to accommodate the volume of water being used.
