

# Submersible Well Pump

The above picture is showing a typical submersible pump. The submersible pump will typically be set near the bottom of the well ( maybe higher if the well is a heavy producer ) and attached to a water line that follows back up the well to the pitless connection. The pump motor ( 230 volt or 115 volt ) turns the pump head thus taking water from the well into the water inlet and out the water outlet and then on up the water line in the well onto the house.
